Abstract With the integrated development of new energy and oil and gas production, introducing wind-solar-storage microgrids in coalbed methane well screw pump discharge systems ...

This paper addresses the insufficient green electricity absorption capacity faced by screw pump production systems in coalbed methane wells, incorporating wind and solar power generation.

In the present work, an integrated system incorporating concentrated solar power and methane bi-reforming was proposed for the co-generation of methanol and electricity.

While the present study offers a comprehensive thermodynamic and emission-based evaluation of coalbed methane utilization in power generation, it is not without limitations.

Medium-thick coal bed demonstrate greater resilience to natural gas price fluctuations. The study confirms that the PV-wind microgrid effectively mitigates energy supply instability and ...

To enhance methane utilization in coal-rich regions and integrate methane power generation with distributed renewable energy systems, this study proposes a coordinated ...

Driven by the Botswana Power Corporation (BPC), the coal bed methane project emerges as a pivotal aspect in enabling flexible, dispatchable power generation, crucial for ...

Electric Power Monthly Includes data on renewables sources by state by sector Hourly Electric Grid Monitor Up-to-the-hour information showing electricity demand and generation by source for 64 ...
