Based on the MATLAB Genetic Algorithm toolbox and using Newmark's method, the dynamic equations of the flipped plastic mechanism system are solved.

The design and theoretical analysis are verified by simulation and experimental results. Can solar cells improve daylighting performance in BIPV windows?

The proper design of a PV system and the proper installation are required to ensure the smooth operation of power plants, both in terms of safety and energy efficiency.

Material Selection: Choose appropriate materials for the mechanism's components. Actuation and Control Design: Select the actuation method and design the control system. Simulation and ...

In this paper a new technique of cooling photovoltaic panels PVs is suggested and investigated theoretically based on experimental behaviour obtained for a single PV panel.

In order to solve the key problem that the flipping shaping mechanism cannot accurately complete the action when the vibration of the mechanism is large. In this paper, the finite element ...

The present system has been developed as an attempt to provide a simple and cost effective solution to such a requirement. The system consists of a rotary disc with radial slots stationed between two ...

The main aim is to design the support structure, transmission mechanism and tilting of the panel automatically on the daily basis depending on the wind pressure, so analysis and manual adjustment ...
