You do not need a solar charge controller for grid-tied residential systems. Instead, the utility grid regulates the electricity flow and absorbs the excess power.

If you're using solar panels to charge batteries, you absolutely need a solar regulator --unless you want to risk damaging your system. Solar regulators (also called charge controllers) act ...

A charge controller, or charge regulator, is basically a voltage and/or current regulator to keep batteries from overcharging. It regulates the voltage and current coming from the solar panels going to the ...

The voltage regulator module chosen for connecting a solar panel primarily depends on several factors, including the output voltage of the solar panel, the requirements of the load, ...

Solar panels convert sunlight into usable electrical energy -- but to truly understand how that energy flows, you need to grasp one fundamental concept: voltage. Voltage determines how ...

A charge controller acts as a safety barrier between panels and a battery and should be a part of every home solar panel installation. In this article, we'll explain how to wire together solar ...

This applies primarily when the solar panel is directly charging a battery with suitable voltage and current levels. However, utilizing a regulator is generally recommended to prevent ...

For an MPPT charge controller to function correctly under all conditions, the solar panel operating voltage (V_{mp}) or the string voltage (if the panels are connected in series) should be at ...
