How much energy did Cuba consume in 2024?

In 2024, billed consumption was 13,985 GWh, a figure close to what was produced, making the energy collapse all the more inexplicable. HAVANA TIMES - Cuba's energy collapse over the last four years is summarized in the 16-page report published this Friday by the National Office of Statistics and Information (Onei).

How much electricity does Cuba use?

As expected, billed consumption is concentrated around the country's largest cities. A significant 3,742 GWh corresponds to Havana--a figure not even approached by Santiago de Cuba, which consumed only 836.9 GWh. However, the provinces with the highest electricity usage are Holguin (1,188.4 GWh), Matanzas (1,131 GWh), and Villa Clara (1,016 GWh).

Why does Cuba have a bad energy system?

Cuba's energy system also suffers from years of reliance on domestic, poor-quality heavy crude oil, which is corrosive because it's high in sulfur. This has accelerated the wear and tear on boilers, turbines, and pipes in Cuba's power plants, shortening their life spans and causing frequent and costly outages.

Does Cuba have an energy crisis?

Cuba isn't just in an energy crisis; the country's grid sits on the verge of systemic failure. The National Electric System, most of which was built after 1959, hasn't received the investment and maintenance it needs for 35 years--a consequence of Cuba's complex political and economic history.

Cuba's energy crisis is causing widespread power outages due to outdated plants and a fragile grid, impacting daily life and nearing total failure.

Total blackout in Cuba: 70% of customers in Havana remain without electricity supply So far, only 30.5% of the city's electricity demand has been met, with 57 connected circuits totaling ...
