Here, we propose geological thermal energy storage (GeoTES) for seasonal energy dispatching.

An electromagnetic sounding instrument is a geophysical device that reconstructs subsurface geological structures by measuring electromagnetic responses (resistivity, polarizability, ...

This review paper examines typical CCUS projects, details the principles of various monitoring methods for CO<sub>2</sub> geological storage, comparatively analyzes the costs of different ...

We have developed a new continuous monitoring system based on small seismic sources and distributed acoustic sensing (DAS). The source system generates continuous ...

We suggest a new approach using a combination of repeated seismic and electromagnetic surveys to delineate CO<sub>2</sub> plume and estimate the gas saturation in a saline ...

Elxon Mining has extended its Smart Marker technology to develop wireless in-ground monitoring systems for mines. The sensors will detect ground movements, allowing mine operators to evaluate ...

This paper provides a review of the investigations on electric field energy and magnetic field energy harvesting for achieving energy-autonomous condition monitoring ...

Microseismic technology has proved its value in unconventional wells, and new applications could enable monitoring of sequestered CO<sub>2</sub> and facilitate geothermal energy ...
