---

Led by Iowa, South Dakota, Kansas, and New Mexico, 30 states generated at least 10% of their in-state electricity from solar and wind combined in 2024. California, Texas, and Florida ...

Wind energy now provides approximately 12% of global electricity demand. The World Wind Energy Association (WWEA) has compiled statistics on global wind power installations for the first half of ...

Wind supplies 57% of Denmark's electricity generation and over 20% in ten other countries. 7 Global wind additions reached a record 117 GW in 2023. 7 In 2024, onshore installations surpassed 100 GW ...

U.S. electricity generation from wind turbines decreased for the first time since the mid-1990s in 2023 despite the addition of 6.2 gigawatts (GW) of new wind capacity last year.

Assuming the turbine produces electricity for 8760 hours in a year, how much electricity does it generate if its power output is 25% of the maximum capacity?

In March and April of 2024, electricity generation from wind exceeded generation from coal, once the dominant source of U.S. electricity, for an extended period for the first time.

Overview Wind power by state History Economics National trends Commercialization of wind power Offshore wind power Wind energy meteorology In 2019, electric power generation from wind power was 10 percent or more in fourteen U.S. states: Colorado, Idaho, Iowa, Kansas, Maine, Minnesota, North Dakota, Oklahoma, Oregon, South Dakota, Vermont, Nebraska, New Mexico, and Texas. Iowa, South Dakota, North Dakota, Oklahoma, and Kansas each had more than 20 percent of their electric power generation come from wind. Twenty states now have more tha...

The 13th annual Cost of Wind Energy Review uses representative utility-scale and distributed wind energy projects to estimate the levelized cost of energy (LCOE) for land-based and offshore wind ...
