With Japan aiming to dramatically increase its solar capacity by 2030, the researchers hope their results will inform broader adoption of agrivoltaics--particularly in rural areas where ...

This study explores the integration of solar energy generation with rice farming through a practice known as agrivoltaics, addressing the critical challenge of balancing renewable energy ...

"Solar sharing" was the concept initially invented by Akira Nagashima Light Saturation Point (Source: Fraunhofer Institute for Solar Energy Systems ISE, 2024) (Source: Japan Solar Sharing Federation)

In Japan, the bottleneck for developing mega-solar PV plants is securing the land. Developers have therefore been eyeing the agrivoltaic market as a substitute. The commissioning of ...

Sun-tracking PV arrays hover three meters above Japanese rice fields. Japan may have found a way to harvest renewable electricity without giving up valuable farmland.

As for solar power generation, the number of suitable sites for installing large-scale power plants is decreasing, which is one of the challenges for expanding renewable energy in Japan. Agricultural ...

ASHIKAGA, Tochigi Prefecture--Vertical solar panels, while now a rare sight on farmland in Japan, in this case a rice paddy, look set to transform the nation's landscape in years to come.

Japan's national ambitions to drastically expand its solar energy capacity by 2030 make this agrivoltaic model particularly timely. As the country grapples with limited land resources, ...
