Learn more about your upcoming transition to Principal. Get the details on your new retirement plan and what you can expect in the move.

The ceramic developed by ETH Zurich features an ingenious nanostructure that effectively converts solar energy into electricity. The photovoltaic material consists of aluminum oxide and ...

Researchers investigated nano ceramic coatings as a solution, which provide advantages such as increased light absorption, durability, and resistance to environmental degradation. This study looks ...

Specifically, the versatility, low production cost, and ease of installation make photovoltaic energy a fundamental player in present and future solutions in this new scenario. One of the strategic ...

Solar panels absorb only visible light to convert to energy through the PV cells. However, this new glass-ceramic material, when placed on top of the panels, allows visible light to pass ...
