---

By 2022 wind was contributing more than 7 percent of the world's total electricity and accounted for more than 10 percent of the total U.S. utility-scale electricity generation.

Learn the facts about renewable power produced by wind, and hear Caltech engineer John Dabiri discuss the pros and cons and the future of wind energy

Will added investment in renewable sources, particularly wind, lead to any increase in the amount of wind power generated? And will that capacity increase or decrease the resiliency of ...

By some metrics, wind power is already competitive with fossil fuels without extra financial help. But other measures don't reach the same conclusion -- and projections vary about what will...

Wind energy is "variable": how much electricity it produces depends on how much wind is blowing. In any energy system that relies partly on wind, other energy sources have to be ramped up ...

Wind power is the nation's largest source of renewable energy, with more than 150 gigawatts of wind energy installed across 42 U.S. States and Puerto Rico. These projects generate ...

Energy from moving air Wind is caused by uneven heating of the earth's surface by the sun. Because the earth's surface is made up of different types of land and water, the earth absorbs ...

Power available in wind is proportional to the cube of wind speed. A small increase in wind speed (from building taller towers) produces a massive increase in available power.
