Dual-glass type modules (also called double glass or glass-glass) are made up of two glass surfaces, on the front and on the rear with a thickness of 2.0 mm each.

o For the PV module produced by Jolywood, two types of cells (namely N-type cell and P-type cell) are used depending on the customer's choice. Generally, the production of N -type cell ...

The findings suggest that the combination of n-type TOPCon cells and EVA encapsulation presents a higher risk of degradation. To mitigate this risk, alternatives to EVA or corrosion-resistant ...

A double glass bifacial module is similar to a basic bifacial module but with a key difference: it has glass on both the front and back sides. This means that the entire module is ...

Glass-glass module structures (Dual Glass or Double Glass) is a technology that uses a glass layer on the back of the modules instead of the traditional polymer backsheet.

Bifacial with Double-Glass Module adopts 182*199mm half cells, bifacialmodule provide an additional 5%~25% output.

Dual glass is the preferred structure for the rear side cover of the N-type modules because the glass-glass version can maximize the advantages of the N-type.

Resistance to Potential-Induced Degradation (PID): Double-glass panels are virtually immune to PID, a key degradation mode that can reduce efficiency in conventional modules. This ...
