Thermal generator parameters, especially by restricting minimum operating levels and ramp rates, impact variable renewable energy (VRE) curtailment more in mid-PV contribution levels ...

Texas has the most wind capacity of any state and can get nearly 50 percent of its generation from wind at certain times of the day. But, the unreliability of wind and solar power is ...

To establish a long-term mechanism and rise above the "new normal" of intermittent imbalance between power supply and demand on the road to decarbonization, we need to ...

The California Independent System Operator (CAISO), the grid operator for most of the state, is increasingly curtailing solar- and wind-powered electricity generation as it balances supply ...

Will more wind and solar PV capacity lead to more generation curtailment? As the penetration of variable renewable energy (VRE) increases, the share of curtailed wind and solar PV generation is ...

The unfortunate result is that the state has so much solar generation at peak hours that the grid operator must curtail 29 percent more electricity than it did in 2023. Curtailment is an ...

This study develops an autonomous fuzzy-based user prioritization model for rationing power generated by the proposed PV system among identified energy user categories using the ...

By 2050, we could more than double our energy consumption globally and solar will still be generating more than we need. This year, around 1 billion solar panels, and 70 billion of their...
