A common challenge in wind turbine generator maintenance is bearing failure due to static discharges and lightning strikes. White-etching cracks (WEC) and other kinds of damage caused by electrical ...

Insulated coating or ceramic hybrid bearing options in stock for many wind turbine generators. Our CB1 retrofit for GE 1.5 turbines includes everything needed to make essentially a drop in replacement. ...

This project aims to explore the problems in the heating assembly process of wind turbine spindles and their components in offshore wind power systems and to propose solutions to ...

Mechanically, all of our repair centers have full service machine shops capable of repairing or re-manufacturing major components including generator shafting, power slip rings, bearing housings, etc.

Bearing replacement is inevitable over time, however, there is a more economical and sustainable option -- remanufacturing. We have previously explored the concept and its benefits, ...

It outlines 4 main steps: 1) Isolating the generator and removing covers to access the drive end bearing. 2) Removing the drive end bearing using a hydraulic press after heating it, and ...

Recent studies have indicated that bearing failure is the prime cause of generator failure, in wind turbine application. Grease lubrication deterioration was found to be the leading cause of motors and ...

The process of replacing bearings in a wind turbine is complex and requires meticulous planning and execution. Here is a detailed overview of the process in English.
